

Course Program: Applied Robotics (FRTN85) &
Applied Robotics for Architects (FRTN80),
7.5 credits, Fall 2024, Study Period 1

August 19, 2024

1 Course Staff

1.1 Course Coordinator and Examiner

- Björn Olofsson, Dept. Automatic Control, LTH
<https://www.control.lth.se/?id=237994>

1.2 Course Administrator

- Mika Nishimura, Dept. Automatic Control, LTH
<https://www.control.lth.se/staff/Mika-Nishimura/>

1.3 Teaching Assistants

- Zheng Jia, Dept. Automatic Control, LTH
- Marko Guberina, Dept. Automatic Control, LTH
- Sebastiano Fregnan, Dept. Automatic Control, LTH
- Anton Tetov Johansson, Dept. Architecture and Built Environment, LTH

1.4 Research Engineer

- Alexander Pisarevskiy, Dept. Automatic Control, LTH

2 Course Homepage and Canvas

3 Overview

Robotics is a broad and interdisciplinary subject, which involves various subjects such as mechanics, automatic control, computer science, sensors and various process-specific applications and methods in production and manufacturing systems. Traditionally, robots have mostly been applied and developed for industrial use in processes like welding, spray painting, and material handling. During recent years, the subject has been broadened to include more complex operations like assembly tasks and human–robot interaction with an emerging need for new areas such as robots in various service applications. An illustrative example is the application area "health care", where robots are used by disabled people to increase the independent living and possible rehabilitation. In addition, robots are increasingly being used in construction and fabrication processes.

3.1 FRTN85 Applied Robotics

The course FRTN85 in robotics intends to introduce robotics for, primarily, applied industrial robotic applications. Within this scope, the course will provide general understanding of concepts in robotics and engineering-related issues like robotic systems design and efficient use of robots in industry. From an application point of view, most examples and case studies will make references to industrial robotics. Where appropriate, however, reference to other areas such as service robotics will be made as well.

3.2 FRTN80 Applied Robotics for Architects

The purpose of FRTN80 is to provide basic knowledge in industrial robotics where the theory is applied within architectural design processes. The course aims to provide an understanding of how robotics can be used for the production and maintenance of the built environment, as well as increase the ability to translate CAD models into robot programs for the production and manipulation of physical media, and how robots can contribute to the design process and sustainability.

4 Objectives

The content of the course follows the schedule described in this document. Examination is based on assignments: computer and lab exercises, hand-in exercises, and a project (report and presentation/demonstration) and **for FRTN85** an optional take-home-exam for higher grades (4 and 5). The assignments have a defined "pass" level and are a requirement to pass the course. The lectures are important for the understanding of the lab/exercises and the projects, and it is highly recommended to follow these lectures. Also, they provide an important source of information for the final take-home-exam **in FRTN85**.

The course focuses on three areas:

1. Characteristic features of robots, simulation, programming, and designing robot systems for industrial applications.
2. Modeling of robots within the scope of kinematics, calibration, and design of robots.
3. Basics of robot dynamics (**FRTN85 only**).
4. Robot system design in architectural design processes (**FRTN80 only**).

The areas are supported through lectures and computer and hands-on lab/exercises. These areas define the course, which is examined through lab/exercise work.

5 Literature

Literature related to the lectures and texts related to exercises/lab work within the course are available at the course Canvas site:

- <https://canvas.education.lu.se/>.

All requirements concerning literature and other material related to the lab/exercise work are defined in the lab/exercise descriptions. Additional material will be provided through the course Canvas site (lab/project descriptions, papers/articles, movies, etc.).

6 Computer Labs

Work related to exercises will be done in the computer labs (in the M-building at LTH). Your student account (STiL) is working in most computer labs on campus where the software used also should be available. You can also connect via VPN to the campus network and access the needed software. The M-building is locked during evenings and weekends. Your LU card will give you access to both the building and the computer labs. If not, please notify Björn Olofsson (bjorn.olofsson@control.lth.se).

7 Examination

Examination is based on the following assignments:

- Computer and lab exercises:
 - Compulsory hands-on exercise in the RobotLab in the M-building during the first course week, introducing the robot systems and discussing safety aspects.
 - RobotStudio Exercises 1–3 (Windows-software run via <https://apps.lu.se/>). A teaching assistant should approve the simulation before running on the real robot (assignment experimentally demonstrated in RobotLab in the M-building).
- Hand-in exercises on kinematics and dynamics (**FRTN85 only**).
- Robot system design for architectural task hand-in exercise in groups of two students (**FRTN80 only**).
- Projects in groups (short written report and demo-presentation in the lab).
- **Optional**: Additional take-home-exam for higher grades (4 and 5) (**FRTN85 only**).

The assignments have a defined “pass” level and are a requirement to pass the course. The take-home-exam is optional (**FRTN85 only**) and is needed for higher grades (4 and 5).

A prerequisite for the take-home-exam is that **all** RobotStudio exercises are approved, and that the hand-in exercises are submitted **before midnight October 25, 2024**.

The 24 h take-home exam is to be solved independently and you are requested to upload your typed solutions and possibly Matlab file(s) or a *readable* scanned version of your solutions to the examiner in the next 24 hours after downloading your exam. The exam will be available to download in Canvas from **October 26, 2024 to November 3, 2024**.

8 Schedule

The schedule describes a timetable for the course divided into weeks. Computer exercises and labs are made with one student per computer, and the number of computers in each room is posted in connection with the sign-up lists. Links to sign-up lists are posted weekly in Canvas for alternative times. There is a limitation on the number of simultaneous RobotStudio licenses of 100, but this should not be a problem for this course. Teacher-supported exercises for the simulation and programming of robots will be in computer rooms in the Mechanical Engineering (M)-building and the RobotLab in the M-building according to bookings in the digital sign-up lists available on Canvas. Your own work can be done at other times as needed, and it is expected that *you will have to work on your own to finish the exercises*.

- The schedule of the lectures and computer exercise sessions is available through Canvas (<https://canvas.education.lu.se/>).

8.1 Lectures

The purpose of the lectures is to introduce and provide you with necessary knowledge and insights to fulfill the tasks, which should be documented in the presentations or reports related to the labs, hand-in exercises, and project works. You can also use the lectures to discuss or ask the lecturer on topics related to the lecture or the lab works. Parts of the lectures are given jointly to FRTN85 and FRTN80, whereas others are given in separate groups as detailed in Canvas.

8.2 Assignments: Computer and Lab Exercises

Computer and lab exercises, as described in separate documents available in Canvas, are mandatory to fulfill the requirements of the course. Detailed information about these will be given during the first part of the course.

Kinematics Kinematics is about three interconnected areas within the scope of robot modeling:

1. Kinematics modeling,
2. Analysis, optimization, and planning,
3. Understanding of general robotic manipulator systems.

The goal is to introduce the basics in robotics modeling related to kinematics, aspects on analysis, optimization, and planning related to singularities, trajectory generation and motion planning, and issues related to calibration. During the lectures the theory is presented, and examples are given. In **FRTN85**, a number of exercises on kinematics and dynamics are to be solved and handed in. Computer tools will include the simulation software used for programming the robot and Peter Corke's Robotic Toolbox in Matlab. Please make sure you use toolbox version 10 or later, see <https://petercorke.com/toolboxes/robotics-toolbox/>.

Programming The robot programming and simulation environment ABB RobotStudio will be used to illustrate concepts of modern robot programming. The program can be run on Windows PCs in the campus computer rooms by using the Google Chrome browser via the link

<https://apps.lu.se>. The RobotStudio exercises will contain **both simulation parts *and* experimental exercises to be verified on an industrial robot in the RobotLab**. Detailed instructions for the RobotStudio exercises are available on Canvas.

Dynamics In **FRTN85**, there will be one optional lab exercise on practical servo/robot joint control in the Automatic Control course lab. Sign-up to this optional lab is made in Canvas. Detailed instructions for the optional lab are posted on Canvas.

Course Projects In course week 3, a number of different project proposals to choose from will be presented and posted on Canvas. The projects are typically carried out in groups of 4–6 students and should be documented by a short report and a presentation/demo in the RobotLab at the end of the course.
